Attrition peaks within the first 2 years

Level 1 employees show stagnation many stay stuck without promotion

● Stayed Level 1 ● Left Level 1

Early manager relationships are associated with higher attrition

IBM shows an overall attrition rate of 16.12% — 237 out of 1,470 employees left the company. 70% of this attrition is concentrated in just 3 roles: Laboratory Technician, Research Scientist, and Sales Executive, primarily at entry level.

1 The Problem

- ### 2 What Does NOT Cause Attrition
- Base salary: the gap between those who stayed and those who left is only \$500–\$700 in the highest-attrition roles. In Sales Executive, some who left earned above average
 - Distance from home : employees who live closer are actually more likely to leave
 - Overtime :distribution is nearly 50/50, showing no clear pattern
 - Work-life balance :most employees who left reported a good work-life balance
 - Job satisfaction : satisfaction levels are evenly distributed among those who left

3 What DOES Cause Attrition

- Limited career growth : 77% of employees who left were at Job Level 1, suggesting limited promotion opportunities
- Lack of equity compensation : employees with no stock options (Level 0) represent 65% of total attrition
- Early tenure risk : attrition peaks at years 1, 2 and 3, suggesting onboarding or expectation misalignment
- Role concentration : Laboratory Technicians, Research Scientists and Sales Executives account for 70% of attrition

4 Recommendations

- High early attrition suggests onboarding gaps. A structured 90-day onboarding for entry-level employees to reduce early attrition.
- Lower stock option access is associated with higher attrition. Expand equity eligibility to entry-level roles to improve retention.
- Attrition peaks within the first 1–3 years. Introduce career check-ins at these stages to reduce disengagement.
- Attrition is concentrated in a few key roles (~70%). Focus retention on Lab Technicians, Research Scientists, and Sales Executives.
