HR Attrition Analysis — Executive Summary

1- The Problem

IBM shows an overall attrition rate of 16.12% — 237 out of 1,470 employees left the company. 70% of this attrition is concentrated in just 3 roles: Laboratory Technician, Research Scientist, and Sales Executive, primarily at entry level.

2-What does NOT cause attrition:

- Base salary : employees with similar salaries both stay and leave
- Distance from home : employees who live closer are actually more likely to leave
- Overtime :distribution is nearly 50/50, showing no clear pattern
- Work-life balance :most employees who left reported a good work-life balance
- Job satisfaction : satisfaction levels are evenly distributed among those who left

3-What DOES cause attrition

- Limited career growth : 77% of employees who left were at Job Level 1, suggesting limited promotion opportunities
- Lack of equity compensation : employees with no stock options (Level 0) represent 65% of total attrition
- Early tenure risk : attrition peaks at years 1, 2 and 3, suggesting onboarding or expectation misalignment
- Role concentration : Laboratory Technicians, Research Scientists and Sales Executives account for 70% of attrition

4-Recommendations

- High early attrition suggests onboarding gaps. A more structured 90-day onboarding process for entry-level employees could help improve early retention.
- Lower stock option access is associated with higher attrition. Expanding equity eligibility to entry-level roles may help increase retention.
- Attrition tends to peak within the first 1–3 years. Introducing career check-ins at these stages could help address early disengagement.
- Attrition is concentrated in a few key roles (~70%). Retention efforts should be prioritized for Laboratory Technicians, Research Scientists, and Sales Executives.
